WALL JIG TABLE

This large jig is used to construct the basic frame of the wall components. Again, if you are only making one Hut, don't bother with this jig. The wall jig table allows us to construct many wall frames fast and accurately.

We initially make one finished frame very meticulously, place it on a 6'X6' table surface (**fig. 1**), and screw down a few wooden cleats around the outside of the frame. When the initial frame—we call it the Mother—is removed (**fig. 2**), the fastened down cleats remain to define the placement of the individual framing members for the next wall frame. Makes things go fast, breezy, and easy!
