

Step 5D: The panels can be moved with two people walking together, holding the panel in an arched position. Start at the back of the Hut. The first panel is the most important to get right. Here are important guide points to follow while positioning your first panel: (1) The long vertical wires of the panel should be facing up and the short horizontal wires should be facing down touching the Hut. Also, the long vertical wires should be parallel

to the rear wall edge (2) Set the bottom of one end of the panel along the chalk line. (3) The panel should overhang the 2X4 wall braces by about 1". (4) On both sides of the Hut, a horizontal wire should be running along the outer edge of the 2X4 wall brace (see page 52, fig. 5I for more detail).

By following the points above you should end up with the panel setting symmetrically on the Hut structure.
