

10BitCoin

A 10BitCoin is the size of a United States 5 cent piece. It is cast from pewter. Because pewter has a low melting temperature, the mold can be made of MDF. Images are laser etched (in reverse, of course). The 5 pieces are aligned with pins and held in a 2" wide machinist's vice during the pour.

Lead free pewter can be purchased in ingot form, melted in a crucible, in a ceramics kiln, and poured with tongs. Note grooves in middle piece of mold are for air venting.
